

## PRODUCT SUPPORT BULLETIN BULLETIN NO. 335

DATE: **September 21, 2001**

MACHINE: **Model M & M2 Ballast Regulator/Snow Clearing Machine**

SERIAL

NUMBER(S): **Model M – through s/n 9906 (9 foot width brooms only)**  
**Model M2 – through s/n 9916**

SUBJECT: **Reinforced Broom Housing Kits**

There are two upgrade kits available for Model M and Model M2 9-Foot Wide Broom Housings to increase the rigidity of the broom housing. This will prevent the flexing and distortion over time that can lead to uneven brooming.

Kit 1 is a **Broom Housing Stiffening Kit, p/n D-33759**. This kit contains all of the parts needed to modify the Broom Housing to the latest design. An experienced welder can install this kit in 6 to 8 hours without removing the Broom Housing from the machine.

Kit 2 is a complete **Replacement Broom Housing or "Outer Shell", p/n A-1214001**. This kit includes twelve (12) bolt-on replaceable polymer wear pieces. These wear pieces will prolong the life of the broom shell. The new stiffeners are also installed on the Replacement Broom Housing. Installation will require disassembling the Broom Assembly to replace the Broom Housing. Two men would be needed along with a 1.5-ton minimum capacity hoist. Installation would require approximately 2 days.

Note: A few units from production years 1998 and 1999 were ordered from the factory with replaceable polymer wear pieces but without the boom housing stiffeners. It would be more cost effective to modify these machines with kit D-33759.
